- Significant Inter-Laboratory variation is observed because of differences in methodology & mode of standardization. Such variation is more significant and frequent in immunological tests, which use antibodies that may have different characteristics.
- We strongly DISCOURAGE SELF INTERPRETATION of LABORATORY REPORT and SELF MEDICATION.
- If the results are alarming or unexpected it is advisable to contact the lab immediately for remedial advice.
- Results pertain to the specimen submitted.

## TEST REPORT

Test Name	Value	Unit	Biological Ref Interval
-----------	-------	------	-------------------------

### Biochemistry

Plasma Glucose Fasting (METHOD:GOD POD)	126.0	mg/dl	70 - 110
Plasma Glucose PP (METHOD:GOD POD)	220.0	mg/dl	70 - 150
Serum Ionized Calcium ** (METHOD:ISE)	1.20	MMOL/L	1.1 - 1.375

**25 (OH) Vitamin D \*\***  
ELFA

PATIENT'S VALUE = **8.1** ng/ml

**Vitamin D Status**

Deficiency : Less than 20ng/ml  
Insufficiency : 20- 29ng/ml  
Sufficiency : 30 - 100ng/ml  
Toxicity: Above 100ng/ml

Vitamin D is a steroid hormone; refers to biologically inert precursors, Vitamin D3 (cholecalciferol) and Vitamin D2 (ergocalciferol).

- Vitamin D3 is synthesized in the skin from 7-dehydrocholesterol in response to sunlight(UV exposure) and some part also comes from diet and supplements.
- Vitamin D2 is synthesized in plants from ergosterol in response to sunlight, and comes essentially from diet and supplements.
- Both Vitamin D3 and Vitamin D2 are converted in the liver to **25(OH) Vitamin D** i.e. 25(OH)D3+25(OH)D2.
- **25(OH) Vitamin D** is biologically inactive, but stable and **best indicator or Vitamin D Status**. It's the storage form and stays in the body for 2-3 weeks.

Test Name

Value

Unit

Biological Ref Interval

• It's very important to not only measure 25(OH) D3 and 25 (OH) D2 both, but a also very important to measure with **equimolarity**. The equimolarity is the way to check the ability of a method to detect both vitamin D2 and Vitamin D3 isomers with same performances.

• 25(OH) Vitamin D is hydroxylated in the kidneys and other tissues to biologically active but unstable form, which is 1,25-Dihydroxy Vitamin D, i.e. 1,25 (OH) 2 Vitamin D. It's closely regulated by PTH and intestinal Ca++

• 25(OH) Vitamin D deficiency occur due to inadequate intake and/or low UV exposure, 1,25(OH)2 Vitamin D deficiency primarily occur in advance renal failure.

\*\*\*Recent studies have shown that 25(OH) Vitamin D levels of 30ng/ml or more required for bone health. High levels of Vitamins D indicates Vitamin D toxicity, but is a rare occurrence.

## TEST REPORT

### GLYCOSYLATED HAEMOGLOBIN--HbA1c HPLC

Test Name	Value	Unit	Reference Value
TEST	RESULTS	UNITS	REF VALUES
(Glycated HbA1c)/ HbA1c	7.2	%	<5.70 NON DIABETIC 5.7-6.4 PREDIABETIC >6.50 DIABETIC
Estimated average glucose (eAG)	160.5	mg/dL	<117 NON DIABETIC 118-139 PREDIABETIC >140 DIABETIC
Hb variant	NOT SEEN		
FOR KNOWN DIABETIC PATIENTS			
GOAL	<7.0		
ACTION SUGGETED	>8.0		

### Clinical Application of HbA1c

#### Diabetic Monitoring

The American Diabetic Association (ADA) guidelines states that the therapeutic goal in caring for diabetic patients should be the normalization of blood glucose levels. Numerous investigations have shown a strong correlation between HbA1c and glycemic control as assessed by traditional assays.

Patients who are meeting their treatment goal and who have stable glycemic control should be monitored with HbA1c test atleast two times a year. For patients whose therapy has changed or who are not meeting the glycemic goal, HbA1c test should be performed quarterly.

#### Diabetic Screening

In Jan 2010, the ADA announced its recommendation for the use of HbA 1c to screen for diabetes. Some of the key highlights of the recommendation include:

## TEST REPORT

Testing for all adults who are overweight (BMI>25 kg/square meter) and have additional risk factors including:

Physical inactivity, first degree relatives with diabetes, members of a high risk ethnic population, HDL cholesterol < 35 mg/dL or TG >250 mg/dL

In the absence of above criteria, screening for diabetes should begin at 45 years of age for all individuals.

### Diabetes Diagnosis

An HbA1c results in the 5.7-6.4% range identifies individuals with high risk for future diabetes (also known as prediabetes). Patients with results of 6.5% or greater are considered to have diabetes after a second test to confirm the initial results.

### Significance and Clinical Application of Estimated Average Glucose (eAG)

In 2008 the ADA introduced the term "estimated average glucose (eAG)" into diabetes management. The eAG is the HbA1c results converted into an average blood glucose level, as one would see with a glucose meter with units of mg/dL or mmol/L (Instead of % HbA1c). For an individual with diabetes, measuring one's daily blood glucose is extremely important, as it is used to adjust one's food intake, insulin dosage and activity level.

The ADA and American Association for Clinical Chemistry (AACC) have determined that the correlation is strong enough to justify reporting both an HbA1c results and an eAG results when an HbA1c test is ordered. According to ADA, reporting results in both % HbA1c and eAG (mg/dL), which is the same unit of measurement as the patient's glucose meter, eliminate potential source of confusion and drives patient compliance.

### Certificate/Traceability of Reference Material and Methods

The method is based on Ion exchange chromatography performed on automated High Performance

## TEST REPORT

Liquid Chromatography (HPLC) BIORAD D-10 system. The method has been certified by NGSP (National Glycohemoglobin standardization Program ) as having documented traceability to Diabetes control and Complication Trial ( DCCT) reference method. The method is not affected Hb variants (HbS ,HbC,HbD and HbE in heterozygous state) and gives a separate peak of Labile HbA1c and Corbamoyl Hb.
