### MRI RIGHT KNEE JOINT

Multiple high resolution MR scanning of the knee joint was done. Serial sections were obtained in the coronal and saggital planes. Fat suppression STIR sequence was obtained. Additional proton density (PD) weighted images were also obtained in the sagittal plane.

#### FINDINGS:-

- Mild discontinuity noted in the fibres of anterior cruciate ligament suggestive of partial tear.
- Posterior horn of medial meniscus showing intrasubstance PD hyperintensity suggestive of grade-II degeneration.
- Mild amount of T2/STIR hyperintense fluid collection noted in knee joint suggestive of effusion.
- The posterior cruciate ligament is normal.
- The lateral menisci reveal normal signal intensity.
- The medial and lateral collateral ligaments are normal.
- The articular margins & joint spaces are maintained.
- The periosseous muscular structures and soft tissues are normal.
- The neurovascular bundle is normal.
- Quadriceps & patellar tendon appear normal.
- Bones forming the knee joint reveals normal marrow signal intensity pattern.
- There is no bony erosion or destruction.

#### OPINION : MRI KNEE FINDING REVEALS:-

- ❖ PARTIAL TEAR OF ACL.
- ❖ GRADE-II DEGENERATION OF POSTERIOR HORN OF MEDIAL MENISCUS.
- ❖ MILD KNEE JOINT EFFUSION.

PLEASE CORRELATE CLINICALLY & ARTHROSCOPICALLY.
