Test Name	Results	Units	Bio. Ref. Interval
C-REACTIVE PROTEIN; CRP, SERUM * (Immunoturbidimetry)	1.93	mg/L	<5.00

Comments

CRP is an acute phase reactant which is used in inflammatory disorders for monitoring course and effect of therapy. It is most useful as an indicator of activity in Rheumatoid arthritis, Rheumatic fever, tissue injury or necrosis and infections. As compared to ESR, CRP shows an earlier rise in inflammatory disorders which begins in 4-6 hrs, the intensity of the rise being higher than ESR and the recovery being earlier than ESR. Unlike ESR, CRP levels are not influenced by hematologic conditions like Anemia, Polycythemia etc.

RHEUMATOID FACTOR (RA), SERUM * (Immunoturbidimetry)	<10.00	IU/mL	<14.00
---	--------	-------	--------

Comments

Rheumatoid factor is an antibody directed against the Fc portion of the IgG molecule. Polyreactive RF has binding specificity for substances other than IgG like nuclear components. This polyreactive RF is usually of the IgM class with low affinity. RF is not specific only for Rheumatoid arthritis, but it is often seen in cases of chronic infection and other systemic inflammatory conditions. Healthy individuals > 65 years of age may also show positive RF results. In addition to the common IgM RF, both IgA RF & IgG RF have been detected. IgA RF has been related to the more severe form of the disease with erosions.

VITAMIN D, 25 - HYDROXY, SERUM (CLIA)	22.48	nmol/L	
--	-------	--------	--

Interpretation

LEVEL	REFERENCE RANGE IN nmol/L	COMMENTS
Deficient	< 50	High risk for developing bone disease
Insufficient	50-74	Vitamin D concentration which normalizes Parathyroid hormone concentration
Sufficient	75-250	Optimal concentration for maximal health benefit
Potential intoxication	>250	High risk for toxic effects

Note

- The assay measures both D2 (Ergocalciferol) and D3 (Cholecalciferol) metabolites of vitamin D.
- 25 (OH)D is influenced by sunlight, latitude, skin pigmentation, sunscreen use and hepatic function.

25 - Hydroxy Vitamin D- Serum	9.8	ng/mL	Deficiency - < 20 Insufficiency - 20 -30 Sufficiency - 30 - 100 Toxicity - >100	CMA

Comments:

- 25 OH Vitamin D is total of Vitamin D in Bone and mineral metabolism was recognized from its first identification as a factor that could cure rickets. However, Vitamin D is now recognized as a prohormone which has multiple roles in maintaining optimal health.
- Vitamin D toxicity is a recognized problem but a rare occurrence. Instead, a recent growing public health problem is Vitamin D insufficiency.

55-100 Yrs	0.5-8.9					16-100 Yrs	70-204

Interpretation:

- Assay results should be interpreted in context to the clinical condition and associated results of other investigations.
- Previous treatment with corticosteroid therapy may result in lower TSH levels while Thyroid hormone levels are normal.
- Results are invalidated if the client has undergone a radionuclide scan within 7-14 days before the test.
- Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved.
- The production, circulation, and disposal of Thyroid hormone are altered throughout the stages of pregnancy.
- Hyperthyroidism (overactive thyroid):**
Hyperthyroidism (overactive Thyroid) occurs when your thyroid gland produces too much of the hormone Thyroxine. Hyperthyroidism can accelerate your body's metabolism, causing unintentional weight loss and a rapid or irregular heartbeat.
- Hypothyroidism (underactive thyroid):**
Hypothyroidism (underactive thyroid) is a condition in which your thyroid gland doesn't produce enough of certain crucial hormones. Hypothyroidism may not cause noticeable symptoms in the early stages. Over time, untreated Hypothyroidism can cause a number of health problems, such as obesity, joint pain, infertility and heart disease.

3rd Trimester	0.30-3.00

Note

TSH levels are subject to circadian variation, reaching peak levels between 2 - 4 a.m. and at a minimum between 6-10 pm. The variation is of the order of 50%, hence time of the day has influence on the measured serum TSH concentrations.

Clinical Use

- Diagnose Hypothyroidism and Hyperthyroidism
- Monitor T4 replacement or T4 suppressive therapy
- Quantify TSH levels in the subnormal range

Increased Levels: Primary hypothyroidism, Subclinical hypothyroidism, TSH dependent Hyperthyroidism, Thyroid hormone resistance

Decreased Levels: Graves disease, Autonomous thyroid hormone secretion, TSH deficiency

MRI OF BRAIN PROCEDURE:

Using the head coil, images of the brain acquired in axial T1, T2, FLAIR, GRE and Diffusion sequences. Study supplemented with sagittal T1 and coronal T2 images of the brain.

FINDINGS:

- Both cerebral hemispheres are normal revealing no obvious focal area of altered signal intensity.
- No area of acute ischemic focus is seen on diffusion images.
- Sylvian fissures, basal cisterns and cortical sulci are normal.
- The ventricular system is normal.
- Basal ganglia, internal capsules and thalami are normal.
- There is no shift of midline structures.
- Sella & para-sellar structures are normal.
- Cerebellum and brain stem are normal in signal characteristics.
- Vascular flow voids are normal.
- Both orbits and intra-orbital structures are normal.
- *Mild T2 hyperintense signals noted in left mastoid air cells – Suggestive of mastoiditis.*
- *Mucosal thickening noted in bilateral maxillary, ethmoid, frontal and sphenoid sinuses suggestive of pansinusitis.*

IMPRESSION: MR imaging features are suggestive of:

- No significant abnormality detected in brain parenchyma.
- Mild left mastoiditis.
- Pansinusitis.

Interpretation:

- Assay results should be interpreted in context to the clinical condition and associated results of other investigations.
- Previous treatment with corticosteroid therapy may result in lower TSH levels while Thyroid hormone levels are normal.
- Results are invalidated if the client has undergone a radioiodine scan within 7-14 days before the test.
- Abnormal thyroid test findings often found in critically ill clients should be repeated after the critical nature of the condition is resolved.
- The production, circulation and disposal of Thyroid hormone are altered throughout the stages of pregnancy.
- **Hyperthyroidism (overactive thyroid):**
Hyperthyroidism (overactive thyroid) occurs when your thyroid gland produces too much of the hormone Thyroxine. Hyperthyroidism can accelerate your body's metabolism, causing unintentional weight loss and a rapid or irregular heartbeat.
- **Hypothyroidism (underactive thyroid):**
Hypothyroidism (underactive thyroid) is a condition in which your thyroid gland doesn't produce enough of certain crucial hormones. Hypothyroidism may not cause noticeable symptoms in the early stages. Over time, untreated Hypothyroidism can cause a number of health problems, such as obesity, joint pain, strokes and heart disease.
