Comments
 Rheumatoid factor is an antibody directed against the Fc portion of the IgG molecule. Polyreactive RF has binding specificity for substances other than IgG like nuclear components. This polyreactive RF is usually of the IgM class with low affinity RF is not specific only for Rheumatoid arthritis, but it is often seen in cases of chronic infection and other systemic inflammatory conditions. Healthy individuals > 65 years of age may also show positive RF results. In addition to the common IgM RF, both IgA RF & IgG RF have been detected. IgA RF has been related to the more severe form of the disease with erosions.

HRCT THORAX

High resolution non contrast CT scan for thorax was done on 128 slice Philips CT scanner from thoracic inlet to diaphragm.

Mosaic pattern of perfusion and diffuse ground glass opacities are seen in bilateral lungs.

Parenchyma and paraseptal honeycombing is noted with surrounding interlobular interstitial thickening causing distortion of the normal lung parenchyma. Subpleural interstitial thickening is also noted.

No enlarged lymph nodes are seen.

Mediastinal vasculature appears normal.

There is no pleural effusion.

Heart is normal in size. There is no pericardial effusion.

Trachea and bronchi appear normal.

Bony cage under view is normal.

Note is made of hiatus hernia.

IMPRESSION :- Interstitial lung disease.

PLEASE CORRELATE CLINICALLY.
