MRI REPORT

MRI - LUMBOSACRAL SPINE

IMAGING PARAMETERS :: SAGITTAL PLANE :: SE T1 AND T2
AXIAL PLANE :: SE T2

There is collapse of L1 with posterior bulge causing compression of conus.

There is grade I anterior displacement of L4 over L5.

Osteophytes are seen at multiple levels.

L1-2, L2-3, L3-4, L4-5 and L5-S1 discs show degenerative changes as seen by the loss of normal hyperintensity on T-2 W images.

L1-2, L2-3, L3-4, L4-5 and L5-S1 discs show diffuse annular bulge causing thecal indentation with bilateral neural foraminal narrowing.

Visualised spinal cord and conus medullaris are normal in contour and signal intensity. There is no evidence of syrinx.

Facet joints and ligamentum flavum are normally visualised.
Lumbar canal is normal in dimensions.

Pre and paravertebral soft tissues are normal.

OPINION::

- * COLLAPSE OF L1 WITH POSTERIOR BULGE CAUSING COMPRESSION OF CONUS
- * GRADE I ANTERIOR SPONDYLOLISTHESIS OF L4 OVER L5.
- * LUMBAR SPONDYLOSIS WITH OSTEOPHYTES.
- * DEGENERATIVE L1-2, L2-3, L3-4, L4-5 AND L5-S1 DISCS CAUSING THECAL SAC INDENTATION AND BILATERAL NEURAL FORAMINAL NARROWING.

MRI CERVICAL SPINE
 IMAGING PARAMETERS::
 SAGGITAL PLANE :: FSE T1, T2
 AXIAL PLANE :: FSE T2

Vertebral bodies show normal height, alignment, and marrow signal intensities. No infective or infiltrative pathology present. Vertebral end plates are normal.

C3-4, C4-5, C5-6 and C6-7 discs show degenerative changes as seen by the loss of normal hyperintensity on T2 W1.

C3-4, C4-5, C5-6 and C6-7 discs shows posterocentral bulging causing thecal and cord indentations.

Visualised part of the spinal cord is normal. No evidence of syringomyelia or hydromyelia is noted. Facet joints and ligamentum flavum are normally visualised. Bony cervical canal is normal in dimensions. Atlanto axial joint is normal.

Pre and para vertebral soft tissues are normal. Dorsal spine visualised show spondylosis with schmorl's nodes.

OPINION ::
 DEGENERATIVE C3-4, C4-5, C5-6 AND C6-7 DISCS WITH POSTEROCENTRAL BULGE CAUSING THECAL AND CORD INDENTATIONS.

ABSOLUTE BASOPHIL COUNT	0	0.02-0.10	10 ³ /uL
METHOD : VCS TECHNOLOGY			

Interpretation(a)

Note: The percentage counting of each type of differential leucocytes does not indicate correctly their absolute increase or decrease, hence as per recommendation of the International Council for Standardization in Hematology the differential leucocyte counts are reported as absolute number of each cell type per unit volume of blood.

Report Status: **Final** REFERRED BY : DR. VIKAS SRIVASTAVA

Tests	Results	Biological Reference Range	Units
-------	---------	----------------------------	-------

HbA1c (GLYCOSYLATED HEMOGLOBIN), WHOLE BLOOD			
HbA1c	11.3	High 4.3 - 6.4	%
METHOD : HIGH PERFORMANCE LIQUID CHROMATOGRAPHY (HPLC).			
MEAN PLASMA GLUCOSE	278	High 70 - 140	mg/dL

Comments
INCREASED LEVELS OF GLYCOSYLATED HEMOGLOBIN MAY NEED CLINICAL CORRELATION WITH COMPLIANCE WITH ANTI DIABETIC THERAPY. HIGH GLYCOSYLATED HEMOGLOBIN LEVELS MAY BE OBSERVED IN CONDITIONS SUCH AS CHRONIC RENAL FAILURE, ABNORMAL HEMOGLOBINOPATHY AND WITH THALASAEMIA.

Interpretation(s)

GOOD CONTROL	6.4 - 7.0
CONTROL	7.0 - 8.0
NOT SUGGESTED	> 8.0

NOTE:
Glycosylated hemoglobin (HbA1c) test is done to assess compliance with therapeutic regimen in diabetic patients. Three monthly monitoring is recommended in clinical management of diabetes. HbA1c is not affected by daily glucose fluctuations, exercise and recent food intake. HbA1c is linearly related to the average blood sugar over the past 1-3 months (but is heavily weighted to the past 2-4 weeks). HbA1c is strongly associated with the risk of development and progression of microvascular and nerve complications. High HbA1c (>9.0-9.5%) is associated with very rapid progression of microvascular complications. Any condition that shorten RBC life span like acute blood loss, hemolytic anemia falsely lower HbA1c results. HbA1c results from patients with HbSS, HbCC, HbSC and HbD must be interpreted with caution, given the pathological processes including anemia, increased red cell turnover, and transfusion requirements that adversely impact HbA1c as a marker of long-term glycemic control. Specimens from patients with polycythemia or post-splenectomy may exhibit increase in HbA1c values due to a somewhat longer life span of the red cells.
The relationship between eAG (Mean Plasma Glucose) and HbA1c based on linear regression analysis : eAG(mg/dl) = (28.7*HbA1c)-46.7, (Diabetes Care 2008;31:1-6).

THIS TEST IS NOT COVERED UNDER NABL SCOPE.

GLUCOSE FASTING, PLASMA			
GLUCOSE FASTING	99.0	70 - 110	mg/dL
METHOD : SPECTROPHOTOMETRY, HEXOKINASE
