Treatment Summary Radiation Oncology

Patient's Name: Mr. V.P. Verma	Reg. No.: 72976	R.T. No.: 1546/12
Diagnosis: Carcinoma right buccal mucosa	Age: 42 years, Gender: Male	
Stage: pT1N0M0		
Associated Disease: Diabetes mellitus, Hypertension	Date of Starting of Radiotherapy: 22/02/2012	
Treating Consultant: Dr. Dinesh Singh	Date of Completion of Radiotherapy: 05/04/2012	

Mr. V.P. Verma, 42 years male is a diagnosed case of Carcinoma right buccal mucosa. He presented at Galaxy Cancer Institute, Pushpanjali Crosslay Hospital on 13/01/2012 with complaint of ulcer right buccal mucosa for last 3 months & advised for surgery. He underwent Right SOHD + Right wide local excision buccal mucosa + bite marginal resection on 30/01/2012 at another hospital. **Post operative specimen histopathology** done on 30/01/2012 reported well differentiated squamous cell carcinoma of right buccal mucosa of size 20x1.8cm. The underlying mandibular bone and upper alveolar bone was free. Lymphovascular emboli and perineurial invasion was not seen. All margins were free of tumor. 0/20 lymph nodes were free of tumor. Maximum depth of invasion of the tumor was 1cm. All 4 lymph nodes of level Ib & 19 lymph nodes of level II-V were free of metastases. All cut margins were free. Again, he presented at our institute on 18/02/2012 for further course of treatment.

Tumour Board Discussion and therapy selection:

He was discussed in the Tumour Board and in view of histopathology report, the consensus opinion was to treat him with Post operative Adjuvant External Beam Radiotherapy. He was counseled regarding various techniques available and he received Adjuvant External Beam Radiotherapy using Image Guided Radiation Therapy (IGRT) technique.

Simulation and Treatment Planning:

A thermoplastic mould of the Face & Neck was prepared in the treatment position to ensure immobilization of the target region during the simulated and actual treatment at each session. A Simulation CT scan was then undertaken with the cast in position and the CT images were transferred to the Treatment Planning System for the relevant Treatment

World Class Cancer Care

Ved Prakash

Planning. After registration of CT images, contouring of the target volumes and normal structures was done. Among the various treatment plans generated, the one that offered the best therapeutic benefit was selected.

Radiotherapy details:

The planned IGRT was delivered on a dual energy linear accelerator equipped with kvCBCT and Portal Imaging facility (Clinac IX™; Varian®) using 6MV photons. The accuracy of the treatment set-up was checked as per standard guidelines.

The therapy was initiated on 22/02/2012 and completed on 05/04/2012.

Dose Prescribed	Dose Achieved
CTV 59.4Gy/33fr	D2% =62.6Gy, D98% =59.6Gy, V59.4Gy =96.7%

The dose fallout to all organs in the vicinity of the target volume was kept within their tolerance limits and doses to some of the salient organs were as follows:

Organ at Risk	Dose Received
PRV Spine	Max. Dose =36.7Gy
Right Parotid-PTV	Mean Dose =21.5Gy
Left Parotid	Mean Dose =2.9Gy
Mandible-PTV	Mean Dose =14.9Gy
Oral Cavity-PTV	Mean Dose =24.9Gy
TM Joint	Mean Dose =22.2Gy
Larynx	Mean Dose =0.9Gy

Treatment tolerance:

He tolerated the treatment fairly well and did not encounter any major adverse episode during therapy.

We wish him a healthy & happy life.

Medication:

He is advised to take the prescribed medicines and to come for follow up on 14/04/2012.

Veel Walke

Precautions:

To observe skin care

To avoid spicy food.

Note: He is advised to contact Galaxy Cancer Institute on 0120-4173000 or Dr. Rashi Agarwal on 9891483550 / Dr. Dinesh Singh on 09811351486 in case of any query or in case of emergency.
