 Age/Sex : 35 years/ female
 Date : 19 December 2016
 Referred by : Dr Onkar Singh Bhadoriya

Report:

MRI of Lumbo-Sacral Spine with Screening of Dorsal and Cervical Spine

High resolution MRI of lumbo-sacral spine was performed on a **3.0 Tesla MR Scanner, Siemens Magnetom Skyra**. Following imaging sequences were obtained:

Axial: T2 and T1 w turbo-spin-echo (TSE)

Coronal: STIR

Sagittal: T2 TSE, T1 TSE

Transitional vertebra is seen at lumbo-sacral junction-Partial sacralization of L5 vertebra.

Degeneration of L3-4 and L4-5 intervertebral discs is seen with reduced disc heights. Vertebral heights are normal with maintained alignment and **exaggerated lordotic curvature**. No evidence of pars interarticularis defect is seen. Bone marrow signal intensity is normal.

Mild posterocentral disc protrusion is seen at L3-4 and L4-5 level indenting thecal sac.

No abnormal pre or para vertebral soft tissue is seen.

No evidence of ligamentum flavum hypertrophy.

Conus medullaris is normal in morphology and signal intensity.

Screening MRI of cervical and dorsal spine was performed with sagittal T2 w images reveals mild disc protrusions at multiple levels indenting thecal sac. Spinal cord is normal in dimensions and signal intensity.

Impression: Mild posterocentral disc protrusion at L3-4 and L4-5 level indenting thecal sac

Transitional vertebra at lumbo-sacral junction-partial sacralization of L5 vertebra
