MPV is the measurement of the average size of Platelets. A High MPV with low Platelet Counts suggests the Bone Marrow is producing Platelets and releasing them into circulation rapidly.

Red Cell Distribution Width (RDW) measures variation in Red blood cell size. Elevated RDW suggests early nutritional deficiency such as iron, folate or Vitamin B12.

Test	Value	Biological Ref Interval	Unit
Non Reactive result implies that antibodies to HIV 1/ 2 have been detected in the sample. This means the patient has either not been exposed to HIV 1/ 2 infection or the sample has been tested during the "window phase" i.e. before the development of detectable levelsof antibodies. Hence a Non Reactive results dose not exclude the possibility of exposure or infection with HIV 1 / 2.			

Recommendations

1. Result to be clinically correlated.
2. Rarely false negative/positivity may occur.
3. Post test counseling available between 9:30 am to 12:00 pm at Scientific Pathology Lab.

LIMITATIONS

As with all diagnostic tests all results must be considered with other clinical information available . A definite clinical diagnosis should only be made after all clinical and laboratory findings have been evaluated.

This test kit cannot detect less than 1 ng/mL of HBsAg in specimens. If the test result is negative and clinical symptoms persist additional follow -up testing using other clinical methods is suggested. A negative results at any time does not preclude the possibility of Hepatitis B infetion.

Interpretation of Result : A sample found borderline or reactive must be retested in duplicate to verify its status. A repeatedly reactive sample, confirmed by supplemental test should be considered positive for anti-HCV. In the case of repeatedly borderline results, analysis of follow-up samples is recommended.

Note

- False positive results are seen in Autoimmune diseases, Rheumatoid factor, Hypergammaglobulinemia, Paraproteinemia, passive antibody transfer, Anti-idiotypes & Anti superoxide dismutase
- Flase negative results are seen in early Acute infection, immunosuppression & Immuno-incompetence
- HCV-RNA PCR recommended in all reactive results to differentiate between past & present infection.

HORMONE - TEST REPORT

TSH	1.24		µIU/ml
Method: CLIA, Sample: Serum			

Note :

TSH levels are subject to circadian variation, reaching peak levels between 2-4 am and at a minimum 6- 10 pm. The variation is of the order of 50%, hence time of the day has influence on the measured TSH concentrations.
