REFERRED BY
 Dr. DEEPAK BANSAL DM.GASTRO
 BANSAL GASTRO LIVER SUPER
 SPECIALITY CENTRE
 Lab MR # 5810818

SPECIMEN INFORMATION
 SAMPLE TYPE : EDTA - Plasma/Serum
 ORDER REQ NO : OREQ-LAB-22-3073151
 LAB ORDER NO: 2215360008
 COLLECTED ON : 24-Jun-2022 00:00
 RECEIVED ON : 26-Jun-2022 14:04
 REPORT STATUS : Completed

MOLECULAR DIAGNOSTICS

Test Name (Methodology)	Result	UOM
Hepatitis B Viral load - Quantitative - PCR		
Hepatitis B Virus Quantitative	20	IU/mL
Hepatitis B Virus Quantitative	164	Copies/mL

Test Observations:

Interpretation:

IU/mL	Interpretation
Not Detected	Sample provided does not contain Hepatitis B Virus DNA
< 10.2	Hepatitis B Virus DNA Detected & below the Detection Limit of the Assay
10.2 - 20000000	Hepatitis B Virus DNA Detected with in the Linear Range of the Assay
> 20000000	Hepatitis B Virus DNA Detected above the Linear Range of the Assay

Methodology:

The test is based on Real Time Polymerase Chain Reaction (RT-PCR) technology, utilizing PCR for the amplification of target sequences, and to get specific probes for the realtime quantification of the amplified DNA. The probes are labelled with fluorescent reporter and quencher dyes. The reagent system includes a heterologous amplification system (Internal Control) to identify possible PCR inhibition and to confirm the integrity of the reagents.

Comments:

Hepatitis B Virus (HBV) may cause acute and chronic hepatitis and is transmitted mainly by body fluids especially serum, sexual transmission and blood transfusion from mother to baby. Complete recovery is seen in majority of infected individuals, but persistent viral replication may cause chronic hepatitis in 1 to 2% in children and 60-90% in patients chronic HBV infection may be upto 5 to 20% and in neonates 80%.

Note:

- The analytical sensitivity of the kit is 10.2 IU/mL. Linear reporting range of the assay is 10.2 - 20000000 IU/mL.
- Paradoxical results may be seen in contaminated samples, selection of inappropriate specimen and inherent PCR inhibitors in the specimen or use of defective technologies.
- The conversion factor calculated for HBV PCR kit: 1 IU/mL corresponds to approximately 8.21 copies/mL.

Uses:

- Monitoring response to therapy in chronic HBV infection. Predicts the response to favourable treatment outcome
- Reappearance or increasing viral load may indicate relapse or resistance to the therapy.
- Used in conjunction with other serological markers in the management of HBV infection.

AmPath collaborates directly with UPMC, one of the top ten hospitals in the United States according to US News & World Report.

NCCT & CECT WHOLE ABDOMEN

Non-enhanced & contrast enhanced (oral + I/V non ionic) helical sections of 1.5 mm. Thickness were taken from domes of diaphragm till pubic symphysis.

Liver is normal in size and enhances homogeneously. No evidence of focal SOL is noted. Intra hepatic biliary radicles are not dilated. Portal vein shows normal enhancement.

Gall bladder is well distended and appears smooth in outline. Wall thickness is normal. There is no evidence of any hyperdense calculus / soft tissue density lesion seen within it. (*Ultrasound is the scanning modality of choice to rule out gall stones*). CBD is normal in course and calibre.

Spleen is normal in size and attenuation. No evidence of focal SOL is noted.

Pancreas is normal in size, shape and enhancement characteristics. No obvious pathology is seen. The main pancreatic duct is not dilated.

Both kidneys are normal in size, shape, position and enhancement pattern. No evidence of focal SOL, hydronephrosis or radio opaque calculus is seen.

Both adrenals are normal in size and attenuation.

Stomach is well distended with contrast and appears normal in size and wall thickness. Small bowel loops are distended with contrast and appear normal. Ileocaecal junction appears normal. There is generalized distension with fecal loading of caecum, ascending and transverse colon. The distal colonic loops appear normal. No focal differential enhancing stricture / bowel thickening is seen. Appendix is not visualized & is not inflamed.

Urinary bladder is well distended. Wall thickness is normal. No evidence of calculus is noted.

Uterus is postmenopausal in status.

No adnexal mass lesion is noted.

Aorta, IVC, celiac, splenic & mesenteric vessels show normal enhancement.

No retroperitoneal or mesenteric lymphadenopathy is noted. There is no pelvic lymphadenopathy.

No free fluid is seen in the peritoneal cavity. There is no pelvic ascites.

Abdominal & pelvic wall musculature and fat planes appear normal.

Visualised basal lungs show mild subpleural atelectatic changes.

Mild scoliosis of lumbar spine is noted with convexity towards left. Moderate degenerative changes are seen in dorso-lumbar spine.

Page 1 of 2...

IMPRESSION:-

- Generalized distension with fecal loading of caecum, ascending and transverse colon, likely due to chronic constipation. The distal colonic loops appear normal. No focal differential enhancing stricture / bowel thickening is seen.
- No other significant abnormality is seen in scanned organs.

Kindly correlate clinically.

CANCER MARKER TEST REPORT

CANCER MARKERS (VIDAS)

CARCINO EMBRYONIC ANTIGEN (CEA)

TEST RESULT	2.76	ng/ml	(0-10)
(Tech : Enzyme Linked Fluorescent Assay)			

INTERPRETATION

CEA is produced by cells during embryonic and fetal life and production ceases at birth. A very low serum concentration can be detected in healthy individuals. Increased CEA levels can be found in certain cases of cancer (Colorectal, breast, lung cancer etc.), but also in non-malignant diseases. Serum CEA levels decrease after treatment & increase in the event of cancer recurrence, residual disease and metastases. The CEA test can be used as an additional test for prognosis and therapeutic monitoring of patients with diagnosed malignant carcinomas. Smokers have higher values than non smokers.

HORMONE TEST REPORT

THYROID FUNCTION TEST

THYROID STIMULATING HORMONE (TSH)	2.50	uIU/mL	0.25 - 5.50
-----------------------------------	------	--------	-------------

COMMENT :- Above mentioned reference ranges are standard reference ranges.

AGE RELATED GUIDELINES FOR REFERENCE RANGES FOR TSH

TSH	NEW BORN (u IU/ml)	INFANT 1.0-38.9	CHILD 1.7-9.1	ADULT 0.7-6.4	0.3-5.6
-----	-----------------------	--------------------	------------------	------------------	---------

NOTE:

TSH levels are subject to circadian variation, reaching peak levels between 2-4 AM and at a minimum between 6-10 PM. The variation is of the order of 50% hence time of the day has influence on the measured serum TSH concentration. Dose and time of drug intake also influence the test result.

3rd Generation Ultra sensitive kits used.

Serum FT3, FT4 and TSH measurements form three components of thyroid screening panel and are useful in diagnosing various disorders of thyroid gland function.

- Primary hyperthyroidism is accompanied by elevated serum T3 & T4 values along with depressed TSH level.
- Primary hypothyroidism is accompanied by elevated serum T3 & T4 values & elevated serum TSH level.
- Normal T3 & T4 levels with high TSH indicate mild / subclinical HYPOTHYROIDISM.
- Slightly elevated T3 levels may be found in pregnancy and in estrogen therapy while depressed levels may be encountered in severe illness, malnutrition, renal failure and during therapy with drugs like propranolol.
- Although elevated TSH levels are nearly always indicative of primary hypothyroidism, rarely they can result from TSH secreting pituitary tumours (secondary hyperthyroidism).

WIDAL TEST

WIDAL:	1/20	1/40	1/80	1/160	1/320
TH :	+	+	+	+	-
TO :	+	+	+	+	-
AH :	-	-	-	-	-
BH :	-	-	-	-	-

Method:- Widal Antigens For Slide Test.

RESULT INTERPRETATION

*In non vaccinated persons the titre as high as 1:80 between 7th or 10th day of fever is of diagnostic value and the same titre increases gradually during period.

*In vaccinated persons the question of anamnestic response should always be borne in mind and 'H' titre should not be taken into account for the purpose of diagnosis unless there is a rising titre of 'H' in subsequent period.

*Please correlate with clinical condition.

DENGUE SEROLOGY

QUALITATIVE DETECTION OF IgM & IgG ANTIBODIES TO DENGUE VIRUS
{ Immunochromatographic Method }

INVESTIGATIONS

RESULT

IgM ANTIBODY

: NON REACTIVE

IgG ANTIBODY

: NON REACTIVE

NS 1 ANTIGEN

: NON REACTIVE

Interpretations:

- Dengue viruses are mosquito-borne viruses.
- Infections may lead to Dengue fever or Dengue haemorrhagic fever and Dengue shock syndrome.
- In the extreme cases, IgM antibodies appear around the 5th day of a Dengue infection, rise for 1 - 3 weeks and last for 60- 90 days.
- IgG antibodies appear by the 14 day in primary infections and on the 2nd day in secondary infections and can usually be detected for life.
- Both Dengue fever IgM & IgG are useful in the early detection of primary and secondary Dengue infections.

SEROLOGY

QUALITATIVE DETECTION OF Antibodies to S. Typhi (IMMUNOCHROMATOGRAPHIC METHOD)

Test Name	Results
IgM Antibodies to S. Typhi	NON REACTIVE
IgG Antibodies to S. Typhi	NON REACTIVE

Interpretations:

- * This test detects the presence of Antibody to S. Typhi (IgM).
- * The conventional Widal Test detects Antibodies to S. Typhi After one week of onset of symptoms.
- * The early rising Antibodies which are predominantly IgM can be detected by this test.
- * This test serves as a marker for recent infection.
