Investigation	Observed Values	Units	Biological Ref. Interval
Serum 25-OH VITAMIN D	19.9	ng/mL	

Interpretation :

Vitamin D deficiency is a cause of secondary hyperparathyroidism which results in impaired bone metabolism (e.g. osteoporosis). Reduced vitamin D has also been associated with increasing risk of many chronic disorders including cancers, autoimmune and cardiovascular disease. Patients that live in northern climates who have limited sunlight exposure are more likely to have Vitamin D deficiencies.

The major storage form of vitamin D is 25-OH vitamin D.

- <10 ng/mL - Severe Deficiency
- 10-30 ng/mL - Mild Deficiency
- 30-80 ng/mL - Normal
- >80 ng/mL - Possible Toxicity

Serum Vitamin B12

259

pg/ml

187.00 - 883.00

Comments

Vitamin B12 concentration <174 pg/ml may cause Megaloblastic anaemia and/or peripheral neuropathies.

Vitamin B12 concentration <150 pg/ml are considered evidence of Vitamin B12 deficiency. Vitamin B12 concentration between 150 pg/ml to 300 pg/ml are considered borderline.

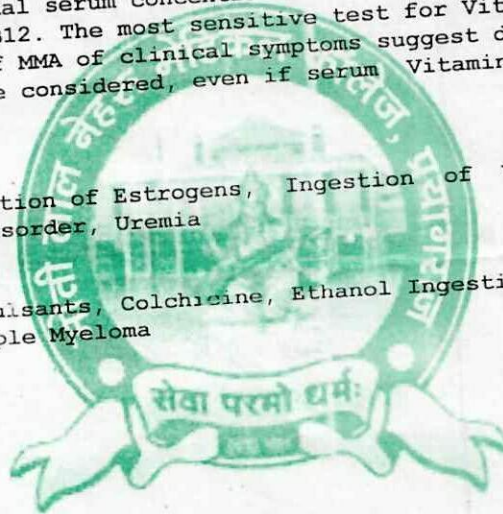

Follow-up testing for antibodies to intrinsic factor (IF) (IFBA/9335 Intrinsic Factor Blocking Antibody, serum) is recommended identify this potential cause of Vitamin B12 metabolism. For specimens without antibodies, following testing of Vitamin B12 tissue deficiency by measuring methylmalonic acid and / or homocysteine may be indicated if the patient is symptomatic. A normal serum concentration of Vitamin B12 does not rule out tissue deficiency of Vitamin B12. The most sensitive test for Vitamin B12 deficiency at the cellular level is the assay of MMA of clinical symptoms suggest deficiency. Measurement of MMA and homocysteine should be considered, even if serum Vitamin B12 concentrations are normal.

Increased :-

Ingestion of Vitamin C, Ingestion of Estrogens, Ingestion of Vitamin A, Hepatocellular Injury, Myeloproliferative Disorder, Uremia

Decreased :-

Pregnancy, Aspirin, Anticonvulsants, Colchicine, Ethanol Ingestion, Contraceptive Hormones, Smoking, Hemodialysis, Multiple Myeloma
